

## Product Announcement

### Kentec BIM file archive launch

Kentec would like to announce that to support our customers we have launched an archive of BIM files for our product range.

BIM – Building Information Modelling is a process used to plan, design, construct, operate and maintain buildings and diverse physical infrastructures. It uses information to be able to efficiently manage the lifecycle of a built asset from concept to end of life.

As a manufacture of fire alarm products which are used in these built assets and infrastructures it is important that we provide information on our product ranges in a format that allow BIM users to utilise them.

BIM files are data rich files which include 3D models of the represented equipment along with technical details, which can easily be integrated into BIM design packages. Our BIM files are created using AutoCAD Revit.

The BIM files are freely available to download from the resources section of our website <https://kentec.co.uk/bim-file-archive/> the archive contains details of the products covered by each file, along with a download link.

**Note:**

BIM files for our Taktis product range are only available through the KIP portal. Should you wish to join our KIP programme please contact your sales representative.

Should you require any further information on this or any of our product range please contact your sales representative.
